

## **DIRECTED WORK SERIES NO. 5**

Module: Algorithmic and data structures1

Academic year: 2023/2024

### **Exercise 1 :**

Write an algorithm that displays the following numbers:

- 1 2 3 4 5 6 7 8 9
- 9 8 7 6 5 4 3 2 1
- 1 2 3 4 6 7 8 9
- 2 4 6 8 10 12 14 16 18
- -1 2 -3 4 -5 6 -7 8 -9

### **Exercise 2:**

Write an algorithm that calculates the product of two positive integer numbers **X** and **Y** without using the multiplication operator (**\***).

### **Exercise 3:**

Write an algorithm that calculates the power  $x^y$ , where  $x$  and  $y$  are integers (All possible cases must be considered).

### **Exercise 4:**

Consider the following algorithm :

```
Algorithm exo5
  N,i,j,S,P : integer ;
begin
  read (N) ;
  if (N<0) then
    write ('error') ;
  else
    S ← 0 ;
    for i going from 1 to N do
      P← 1;
      for j going from 1 to i do
        P← P * j;
      End for
      S ← S + P;
    End for
  End if
  write (S) ;
end.
```

### **Questions :**

- 1) Provide the execution results for:  $N = -3$ ,  $N = 0$ ,  $N = 5$ ?
- 2) What does this algorithm do (provide the general form of the sum  $S = \dots$ )?
- 3) Rewrite the algorithm using a single loop.
- 4) Is there another method to ensure that the entered value of  $N$  is positive, which one?

### **Exercise 5**

Write algorithms that allow to :

- 1) Calculate and display the sum  $S = x + x^2 + x^3 + \dots x^n$ .
- 2) Calculate and display the sum  $S = x - x^2 + x^3 - \dots x^n$ .
- 3) Calculate and display the approximate value of  $e^x$  given by Taylor Formula.

Let's consider the mathematical Taylor formula (1715) that allows for the approximate calculation of the exponential function,  $e^x$  :

$$e^x = \sum_{i=0}^n \frac{x^i}{i!} = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \frac{x^n}{n!} \quad \text{where : } \begin{cases} x: \text{ is a real number} \\ n : \text{ is a positive integer number.} \end{cases}$$

### **Exercise 6: (supplementary)**

- 1) Write an algorithm that reads a positive integer N and displays the number of digits it contains.
- 2) Write an algorithm that determines whether a read positive integer N is prime or not.
- 3) Write an algorithm that displays all prime numbers less than 100.
