

Chapter 5: multi-degree-of-freedom systems.

5.1. Degree of freedom

The number of degrees of freedom is defined by the number of independent variables required to describe the motion of a system. Let's consider a system with n degrees of freedom, subject to forces deriving from a potential, frictional forces due to viscosity and external forces. If the generalized coordinates are q_1, q_2, \dots, q_n , Lagrange's equations can be written as follows:

$$\left\{ \begin{array}{l} \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{q}_1} \right) - \left(\frac{\partial L}{\partial q_1} \right) + \left(\frac{\partial D}{\partial \dot{q}_1} \right) = F_1 \\ \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{q}_2} \right) - \left(\frac{\partial L}{\partial q_2} \right) + \left(\frac{\partial D}{\partial \dot{q}_2} \right) = F_2 \\ \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{q}_n} \right) - \left(\frac{\partial L}{\partial q_n} \right) + \left(\frac{\partial D}{\partial \dot{q}_n} \right) = F_n \end{array} \right. \quad (5.1)$$

5.2 Equations of motion for a system with two degrees of freedom

The two independent variables are x_1 and x_2 , the coupling element is the spring K as shown in the following figure

The kinetic energy of this system is given by

$$T = \frac{1}{2} m \dot{x}_1^2 + \frac{1}{2} m \dot{x}_2^2$$

And the potential energy is given by

$$U = \frac{1}{2}kx_1^2 + \frac{1}{2}kx_2^2 + \frac{1}{2}k(x_1 - x_2)^2$$

The Lagrangian is

$$L = T - U = \frac{1}{2}m\dot{x}_1^2 + \frac{1}{2}m\dot{x}_2^2 - \frac{1}{2}kx_1^2 - \frac{1}{2}kx_2^2 - \frac{1}{2}k(x_1 - x_2)^2$$

The system of differential equations is written as follows:

$$\begin{cases} \frac{d}{dt}\left(\frac{\partial L}{\partial \dot{x}_1}\right) - \left(\frac{\partial L}{\partial x_1}\right) = 0 \\ \frac{d}{dt}\left(\frac{\partial L}{\partial \dot{x}_2}\right) - \left(\frac{\partial L}{\partial x_2}\right) = 0 \end{cases} \Rightarrow \begin{cases} m_1\ddot{x}_1 + (K_1 + K)x_1 - Kx_2 = 0 \\ m_2\ddot{x}_2 + (K_2 + K)x_2 - Kx_1 = 0 \end{cases} \quad (5.2)$$

Sinusoidal solutions are proposed to solve this system of linear differential equations, where the masses oscillate at the same pulsation ω_p with different amplitudes and phases.

5.3. Propres modes

The solution of the previous system is of the following form

$$x_1(t) = A \cos(\omega_p t + \varphi)$$

Et (5.3)

$$x_2(t) = B \cos(\omega_p t + \varphi)$$

So :

$$\dot{x}_1(t) = -A\omega \sin(\omega_p t + \varphi)$$

$$\dot{x}_2(t) = -B\omega \sin(\omega_p t + \varphi)$$

And :

$$\ddot{x}_1(t) = -A\omega^2 \cos(\omega_p t + \varphi)$$

$$\ddot{x}_2(t) = -B\omega^2 \cos(\omega_p t + \varphi)$$

By replacing with $x_1(t)$, $\ddot{x}_1(t)$, $x_2(t)$ et $\ddot{x}_2(t)$,

The system becomes as follows:

$$\begin{cases} \left(-\omega_p^2 + \frac{K_1+K}{m_1}\right)A - \frac{K}{m_1}B = 0 \\ -\frac{K}{m_2}A + \left(-\omega_p^2 + \frac{K_2+K}{m_2}\right)B = 0 \end{cases} \quad (5.4)$$

$$\Leftrightarrow \begin{bmatrix} -\omega_p^2 + \frac{K_1+K}{m_1} & -\frac{K}{m_1} \\ -\frac{K}{m_2} & -\omega_p^2 + \frac{K_2+K}{m_2} \end{bmatrix} \begin{bmatrix} A \\ B \end{bmatrix} = 0 \quad (5.5)$$

System (5.3) has a solution if and only if $A=B = 0$ or

$$\begin{vmatrix} -\omega_p^2 + \frac{K_1+K}{m_1} & -\frac{K}{m_1} \\ -\frac{K}{m_2} & -\omega_p^2 + \frac{K_2+K}{m_2} \end{vmatrix} = 0$$

$$\omega_p^4 - (\omega_1^2 + \omega_2^2)\omega_p^2 + \omega_1^2\omega_2^2(1 - k^2) = 0$$

where

$$\omega_1^2 = \frac{K_1}{m_1} \quad \omega_2^2 = \frac{K_2}{m_2} \quad \text{et} \quad k = \frac{K^2}{(K_1+K)(K_2+K)}$$

Where k is the coupling coefficient. The two natural pulsations are

$$\omega_{p1}^2 = \frac{\omega_1^2 + \omega_2^2}{2} - \frac{1\sqrt{(\omega_1^2 + \omega_2^2) + 4k\omega_1^2\omega_2^2}}{2}$$

$$\omega_{p2}^2 = \frac{\omega_1^2 + \omega_2^2}{2} + \frac{1\sqrt{(\omega_1^2 + \omega_2^2) + 4k\omega_1^2\omega_2^2}}{2}$$

Let's assume $K = K_1 = K_2$ et $m = m_1 = m_2$ to simplify the calculations; so the system of equations becomes :

$$\begin{cases} m\ddot{x}_1 + 2Kx_1 - Kx_2 = 0 \\ m\ddot{x}_2 + 2Kx_2 - Kx_1 = 0 \end{cases} \quad (5.6)$$

So the proper pulsations are

$$x_1(t) = A\cos(\omega_p t + \varphi)$$

And

$$x_2(t) = B\cos(\omega_p t + \varphi)$$

In system (5.6), we obtain

$$\begin{cases} (-m\omega_p^2 + 2K)A - KB = 0 \\ (-m\omega_p^2 + 2K)B - KA = 0 \end{cases} \Leftrightarrow \begin{vmatrix} -m\omega_p^2 + 2K & -K \\ -K & -m\omega_p^2 + 2K \end{vmatrix} = 0$$

$$(-m\omega_p^2 + 2K)^2 - K^2 = 0 \Rightarrow \begin{cases} 3K - m\omega_p^2 = 0 \\ K - m\omega_p^2 = 0 \end{cases}$$

$$\begin{cases} \omega_{p1} = \sqrt{\frac{K}{m}} \\ \omega_{p2} = \sqrt{\frac{3K}{m}} \end{cases}$$

So the general solutions are :

$$\begin{cases} x_1(t) = A_1 \cos(\omega_{p1}t + \varphi_1) + A_2 \cos(\omega_{p2}t + \varphi_2) \\ x_2(t) = B_1 \cos(\omega_{p1}t + \varphi_1) + B_2 \cos(\omega_{p2}t + \varphi_2) \end{cases} \quad (5.7)$$

$$\begin{cases} x_1(t) = A_1 \cos\left(\sqrt{\frac{K}{m}}t + \varphi_1\right) + A_2 \cos\left(\sqrt{\frac{3K}{m}}t + \varphi_2\right) \\ x_2(t) = B_1 \cos\left(\sqrt{\frac{K}{m}}t + \varphi_1\right) + B_2 \cos\left(\sqrt{\frac{3K}{m}}t + \varphi_2\right) \end{cases} \quad (5.8)$$

Supposons que les deux masses oscillent avec le même battement ω_{p1} puis ω_{p2}

1^{er} cas $\omega = \omega_{p1}$

$$\begin{cases} x_1(t) = A_1 \cos\left(\sqrt{\frac{K}{m}}t + \varphi_1\right) \\ x_2(t) = B_1 \cos\left(\sqrt{\frac{K}{m}}t + \varphi_1\right) \end{cases} \quad (5.9)$$

Where $x_1(t)$ et $x_2(t)$ are the solutions of differential equation

$$\begin{bmatrix} -m\omega_{p1}^2 + 2K & -K \\ -K & -m\omega_{p1}^2 + 2K \end{bmatrix} \begin{bmatrix} A_1 \\ B_1 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

And

$$\begin{cases} (-m\omega_{p1}^2 + 2K) A_1 - KB_1 = 0 \\ -KA_1 + (-m\omega_{p1}^2 + 2K) B_1 = 0 \end{cases} \quad (5.10)$$

So : $\frac{A_1}{B_1} = \frac{-K}{-m\omega_{p1}^2 + 2K}$ et $\frac{A_1}{B_1} = \frac{-m\omega_{p1}^2 + 2K}{-K}$

And : $\frac{A_1}{B_1} = 1 \Rightarrow A_1 = B_1$ (x_1 et x_2 are in phase)

1st case $\omega = \omega_{p2}$

$$\begin{cases} x_1(t) = A_2 \cos\left(\sqrt{\frac{3K}{m}}t + \varphi_2\right) \\ x_2(t) = B_2 \cos\left(\sqrt{\frac{3K}{m}}t + \varphi_2\right) \end{cases}$$

\Rightarrow

$$\begin{bmatrix} -m\omega_{p2}^2 + 2K & -K \\ -K & -m\omega_{p2}^2 + 2K \end{bmatrix} \begin{bmatrix} A_2 \\ B_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$\Rightarrow A_2 = -B_2$ (x_1 et x_2 Are in phase opposition)

So:

$$\begin{aligned} x_1(t) &= A_1 \cos\left(\sqrt{\frac{K}{m}}t + \varphi_1\right) + A_2 \cos\left(\sqrt{\frac{3K}{m}}t + \varphi_2\right) \\ x_2(t) &= A_1 \cos\left(\sqrt{\frac{K}{m}}t + \varphi_1\right) - A_2 \cos\left(\sqrt{\frac{3K}{m}}t + \varphi_2\right) \end{aligned}$$

We find A_1, A_2, φ_1 et φ_2 from initial conditions.

The phenomenon studied is the beat:

Systems with two degrees of freedom

Let an external force be applied to the first subsystem; this force to the next force:

The new equations of motion are :

$$\begin{cases} \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{x}_1} \right) - \left(\frac{\partial L}{\partial x_1} \right) = f(t) \\ \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{x}_2} \right) - \left(\frac{\partial L}{\partial x_2} \right) = 0 \end{cases} \Rightarrow \begin{cases} m_1 \ddot{x}_1 + (K_1 + K)x_1 - Kx_2 = f(t) \\ m_2 \ddot{x}_2 + (K_2 + K)x_2 - Kx_1 = 0 \end{cases}$$

Particular solutions have the form

$$\begin{cases} x_1(t) = A_1 e^{i(\omega_p t + \varphi)} \\ x_2(t) = A_2 e^{i(\omega_p t + \varphi)} \end{cases} \Rightarrow \begin{cases} \ddot{x}_1(t) = -\omega_p^2 e^{i(\omega_p t + \varphi)} \\ \ddot{x}_2(t) = -\omega_p^2 e^{i(\omega_p t + \varphi)} \end{cases}$$

By replacing the solutions in the differential system, we obtain

$$\begin{cases} (-m\omega_p^2 + 2K)A_1 e^{i\varphi} - KA_2 e^{i\varphi} = f_0 \\ (-m\omega_p^2 + 2K)A_2 e^{i\varphi} - KA_1 e^{i\varphi} = 0 \end{cases}$$

The amplitude modules are

$$\begin{cases} A_1 = \frac{\begin{vmatrix} f_0 & -K \\ 0 & -m\omega_p^2 + 2K \end{vmatrix}}{\begin{vmatrix} -m\omega_p^2 + 2K & -K \\ -K & -m\omega_p^2 + 2K \end{vmatrix}} = \frac{\frac{f_0}{m}(-\omega^2 + \frac{K}{m})}{(\omega^2 - \omega_{1p}^2)(\omega^2 - \omega_{2p}^2)} \\ A_2 = \frac{\begin{vmatrix} -m\omega_p^2 + 2K & f_0 \\ -K & 0 \end{vmatrix}}{\begin{vmatrix} -m\omega_p^2 + 2K & -K \\ -K & -m\omega_p^2 + 2K \end{vmatrix}} = \frac{\frac{f_0 K}{m^2}}{(\omega^2 - \omega_{1p}^2)(\omega^2 - \omega_{2p}^2)} \end{cases}$$

The phenomena studied are

$$\text{➤ Resonance } \begin{cases} A_1 \rightarrow \infty \\ A_2 \rightarrow \infty \end{cases} \text{ where } \begin{cases} \omega \rightarrow \omega_{1p} \\ \omega \rightarrow \omega_{2p} \end{cases}$$

➤ Anti-resonance $\begin{cases} A_1 \rightarrow 0 \\ A_2 \rightarrow \textit{constante} \end{cases}$ where $\omega \rightarrow \frac{K}{m}$
