# Analysis I: Solutions of Tutorial Exercise Sheet 2

.

This document is supplemented for the second chapter lecture notes (Analyses 1).

# Exercise 01:

Let us take  $n \in \mathbb{N}$ , then we have:

- (a) For  $n \in \mathbb{N}$  we have  $-\frac{1}{2}, \frac{1}{5}, \frac{3}{8}, \frac{5}{11}, \frac{7}{14}$ .
- (b) For  $n \in \mathbb{N}^*$  we have  $2, 0, \frac{2}{9}, 0, \frac{2}{25}$ .
- (c) For  $n \in \mathbb{N}^*$  we have  $\frac{1}{2}, -\frac{1}{8}, \frac{1}{48}, -\frac{1}{384}, \frac{1}{3840}$
- (d) For  $n \in \mathbb{N}^*$  we have  $\frac{1}{2}, \frac{1}{2} + \frac{1}{4}, \frac{1}{2} + \frac{1}{4} + \frac{1}{8}, \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16}, \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32}$

# Exercise 02:

- (a) For values of  $u_1 = 0.22222...$ ,  $u_5 = 0.56000...$ ,  $u_{10} = 0.64444...$ ,  $u_{100} = 0.73827...$ ,  $u_{1000} = 0.74881...$ ,  $u_{10000} = 0.74988...$  and  $u_{100000} = 0.74998...$  A reasonable guess is that the limit is 3/4. It's important to note that this limit becomes evident only for sufficiently large values of n.
- (b) To verify this limit by using the definition: We need to demonstrate that for any given positive value  $\varepsilon$ , there exists a corresponding number N (dependent on  $\varepsilon$ ) such that  $|u_n \frac{3}{4}| < \varepsilon$  for all n > N. By manipulating the expression,  $\left|\frac{3n-1}{4n+5} \frac{3}{4}\right| < \varepsilon$ , we find that  $\left| -\frac{19}{4(4n+5)} \right| < \varepsilon$ , which leads to  $\frac{19}{4(4n+5)} < \varepsilon \iff \frac{4(4n+5)}{19} > \frac{1}{\varepsilon}$ .

We can simplify and derive conditions such as  $4n+5 > \frac{19}{4\varepsilon} \iff n > \frac{1}{4} \left( \frac{19}{4\varepsilon} - 5 \right)$ . Choosing  $N = \left[ \frac{1}{4} \left( \frac{19}{4\varepsilon} - 5 \right) \right] + 1$  accordingly ensures that the limit as n approaches infinity is indeed 3/4.

#### Exercise 03:

- $\begin{array}{ll} \text{(1)} & \lim_{n \to +\infty} \frac{3n-1}{2n+3} = \frac{3}{2} \iff \forall \varepsilon > 0, \exists ? n_{\varepsilon} \in \mathbb{N}, \forall n \in \mathbb{N}; n \geq n_{\varepsilon} \Rightarrow \left| \frac{3n-1}{2n+3} \frac{3}{2} \right| < \varepsilon \\ & \text{We use } \left| \frac{3n-1}{2n+3} \frac{3}{2} \right| < \varepsilon, \text{ then we have } \left| \frac{2(3n-1)-3(2n+3)}{2(2n+3)} \right| = \left| \frac{6n-2-6n-9}{(4n+6)} \right| = \frac{11}{(4n+6)} < \varepsilon \iff \frac{11}{4\varepsilon} \frac{3}{2} < n. \end{array}$  For this, it is sufficient to take  $n_{\varepsilon} = \lceil \frac{11}{4\varepsilon} \frac{3}{2} \rceil + 1.$
- (2)  $\lim_{n \to +\infty} \frac{(-1)^n}{2n} = 0 \iff \forall \varepsilon > 0, \exists ? n_{\varepsilon} \in \mathbb{N}, \forall n \in \mathbb{N}; n \geq n_{\varepsilon} \Rightarrow \left|\frac{1}{2^n}\right| < \varepsilon.$  We have  $\frac{1}{2^n} < \varepsilon$  leads to  $-\frac{\ln \varepsilon}{\ln 2} < n$ . For this, it is sufficient to take  $n_{\varepsilon} = \lceil -\ln(\varepsilon)/\ln(2) \rceil + 1$ .
- $\begin{array}{ll} \text{(3)} & \lim_{n \to +\infty} \frac{2 \ln(1+n)}{\ln(n)} = 2 \iff \forall \varepsilon > 0, \exists ? n_\varepsilon \in \mathbb{N}, \forall n \in \mathbb{N}; n \geq n_\varepsilon \Rightarrow \left| \frac{2 \ln(1+n)}{\ln(n)} 2 \right| < \varepsilon. \\ & \text{So we take, } \left| \frac{2 \ln(1+n)}{\ln(n)} 2 \right| = \left| \frac{2 \ln(1+n) 2 \ln(n)}{\ln(n)} \right| = 2 \left| \frac{\ln(\frac{1+n}{n})}{\ln(n)} \right| = \frac{2 \ln\left(\frac{1}{n} + 1\right)}{\ln n} \end{array}$

Then we can use:  $\forall n \in \mathbb{N}^*$ :  $\frac{1}{n} \leq 1$  so that we have  $\frac{1}{n} + 1 \leq 2$ , which leads to  $\frac{2\ln(\frac{1}{n}+1)}{\ln n} \leq \frac{2\ln 2}{\ln n}$ . Thus, we can choose  $\left|\frac{2\ln(1+n)}{\ln(n)} - 2\right| < \frac{2\ln(\frac{1}{n}+1)}{\ln n} < \varepsilon$ , which leads to  $n > e^{\frac{2\ln 2}{\ln n}}$ . For this, it is sufficient to take  $n_{\varepsilon} = \lceil e^{2\ln(2)/\varepsilon} \rceil + 1$ .

- (4)  $\lim_{n \to +\infty} 3^n = +\infty \iff (\forall A > 0, \exists ? n_A \in \mathbb{N}, \forall n \in \mathbb{N}; n \ge n_A \Rightarrow 3^n > A)$ . We have  $3^n > A \iff n > \frac{\ln A}{\ln 3}$ . For this, take  $n_A = \lceil |\ln(A)/\ln(3)| \rceil + 1$ .
- $(5) \lim_{n \to +\infty} \frac{-5n^2 2}{4n} = -\infty \iff \forall B < 0, \exists ?n_B \in \mathbb{N}, \forall n \in \mathbb{N}; n \ge n_B \Rightarrow \frac{-5n^2 2}{4n} < B.$

We have  $\frac{-5n^2-2}{4n} < B \iff \frac{5n^2+2}{4n} > -B$ . It is obvious that; for all  $n \in \mathbb{N}^*$  we have  $5n^2+2 > 5n^2$ , which leads to  $\frac{5n^2+2}{4n} > \frac{5n}{4}$ . Thus, for  $\frac{5n^2+2}{4n} > -B$  it is sufficient to take  $\frac{5n}{4} > -B \iff n > \frac{-4B}{5}$ . For this, take  $n_B = \lceil -4B/5 \rceil + 1$ .

(6)  $\lim_{n \to +\infty} \ln(\ln(n)) = +\infty \iff (\forall A > 0, \exists ? n_A \in \mathbb{N}, \forall n \in \mathbb{N}; n \ge n_A \Rightarrow \ln(\ln(n)) > A)$ 

For this, take  $n_A = \lceil e^{e^A} \rceil + 1$ .

# Exercise 04:

 $(v_n)$  increasing  $\iff \forall n > 0; \ v_{n+1} \geq v_n \iff v_{n+1} - v_n \geq 0.$  So we have

$$v_{n+1} - v_n = \frac{u_1 + u_2 + \dots + u_{n+1}}{n+1} - \frac{u_1 + u_2 + \dots + u_n}{n}$$

$$= \frac{(nu_1 + nu_2 + \dots + nu_n) + nu_{n+1}}{n(n+1)} - \frac{(nu_1 + nu_2 + \dots + nu_n) + u_1 + u_2 + \dots + u_n}{n(n+1)}$$

$$= \frac{-u_1 - u_2 - \dots - u_n + nu_{n+1}}{n(n+1)}$$

$$= \frac{(u_{n+1} - u_1) + (u_{n+1} - u_2) + \dots + (u_{n+1} - u_n)}{n(n+1)}$$

Since the sequence  $(u_n)$  is increasing, for all integers k, k = 1, 2, ..., n,  $u_k \le u_{n+1}$ , and thus  $v_{n+1} - v_n \ge 0$ . Therefore, the sequence  $(v_n)$  is increasing.

#### Exercise 05:

1. Let's assume by contradiction that  $(u_n)_{n\in\mathbb{N}}$  converges to two different limits  $l_1$  and  $l_2$  such that  $l_1\neq l_2$ . Then we have:

$$(\lim_{n\to+\infty} u_n = l_1) \Rightarrow (\forall \varepsilon > 0, \exists n_{\varepsilon_1} \in \mathbb{N}, \forall n \in \mathbb{N}, n \ge n_{\varepsilon_1} \Rightarrow |u_n - l_1| < \frac{\varepsilon}{2})$$

$$(\lim_{n\to+\infty} u_n = l_2) \Rightarrow (\forall \varepsilon > 0, \exists n_{\varepsilon_2} \in \mathbb{N}, \forall n \in \mathbb{N}, n \geq n_{\varepsilon_2} \Rightarrow |u_n - l_2| < \frac{\varepsilon}{2})$$

Now, let  $n_{\varepsilon_0} = \max(n_{\varepsilon_1}, n_{\varepsilon_2})$ , then for all  $n \geq n_{\varepsilon_0}$ , we have:

$$|l_2 - l_1| = |(u_n - l_1) + (l_2 - u_n)| \le |(u_n - l_1)| + |(u_n - l_2)| < \varepsilon$$

This leads to  $|l_2 - l_1| < \varepsilon$ . Regardless of how small the positive number  $\varepsilon$ , this statement holds true. So,  $\varepsilon$  must be zero, which contradicts the assumption  $l_1 \neq l_2$ . Therefore,  $l_1 = l_2$ , which is absurd.

- 2. The sequence  $(u_n)_{n\in\mathbb{N}}$  is bounded  $\iff |u_n| < P; \ \forall n \in \mathbb{N}$ , where  $P \ge 0$ .
  - $\lim_{n \to +\infty} u_n = l \implies \forall \varepsilon > 0, \exists n_{\varepsilon} \in \mathbb{N}, \forall n \in \mathbb{N}, n \ge n_{\varepsilon} \Rightarrow |u_n l_2| < \varepsilon.$

Let us take:

$$|u_n| = |u_n - l + l| \le |u_n - l| + |l| < \varepsilon + |l|; \quad \forall n > n_{\varepsilon}$$

So it is sufficient to choose  $P = \varepsilon + |l|$ .

3.  $(\lim_{n\to+\infty}u_n=A)\Rightarrow (\forall \varepsilon>0, \exists n_{\varepsilon_1}\in\mathbb{N}, \forall n\in\mathbb{N}, n\geq n_{\varepsilon_1}\Rightarrow |u_n-A|<\frac{\varepsilon}{2})$ 

$$(\lim_{n\to+\infty}v_n=B)\Rightarrow (\forall \varepsilon>0, \exists n_{\varepsilon_2}\in\mathbb{N}, \forall n\in\mathbb{N}, n\geq n_{\varepsilon_2}\Rightarrow |u_n-B|<\frac{\varepsilon}{2})$$

We have:

$$|(u_n + v_n) - (A + B)| \le |u_n - A| + |v_n - B| < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon, \quad \forall n > n_{\varepsilon}$$

where  $n_{\varepsilon} = \max(n_{\varepsilon_1}, n_{\varepsilon_2})$ .

we get:

$$\forall \varepsilon > 0, \exists n_{\varepsilon} \in \mathbb{N}, \forall n \in \mathbb{N}, n \geq n_{\varepsilon} \Rightarrow |(u_n + v_n) - (A + B)| < \varepsilon$$

which is the definition of:  $\lim_{n \to +\infty} (u_n + v_n) = A + B$ .

4. We have:

$$|u_n \cdot v_n - A \cdot B| = |u_n(v_n - B) + B(u_n - A)| \le |u_n||v_n - B| + |B||u_n - A| \le P|v_n - B| + (|B| + 1)|u_n - A|$$
(1)

where we use the fact that  $|u_n| < P$  because the sequence  $(v_n)_{n \in \mathbb{N}}$  is convergent.

• 
$$(\lim_{n\to+\infty}u_n=A)\Rightarrow (\forall \varepsilon>0, \exists n_{\varepsilon_1}\in\mathbb{N}, \forall n\in\mathbb{N}, n\geq n_{\varepsilon_1}\Rightarrow |u_n-A|<\frac{\varepsilon}{2P})$$

• 
$$(\lim_{n\to+\infty} v_n = B) \Rightarrow (\forall \varepsilon > 0, \exists n_{\varepsilon_2} \in \mathbb{N}, \forall n \in \mathbb{N}, n \ge n_{\varepsilon_2} \Rightarrow |u_n - B| < \frac{\varepsilon}{2(|B|+1)})$$

So we find:  $\forall \varepsilon > 0, \exists n_{\varepsilon} \in \mathbb{N}, \forall n \in \mathbb{N}, n \geq n_{\varepsilon} \Rightarrow |u_n \cdot v_n - A \cdot B| < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$ , where  $n_{\varepsilon} = \max(n_{\varepsilon_1}, n_{\varepsilon_2})$ . We get the definition of:  $\lim_{n \to +\infty} (u_n \cdot v_n) = A \cdot B$ .

5. (a) We need to demonstrate that:  $\forall \varepsilon > 0, \exists n_{\varepsilon} \text{ such that } \forall n \in \mathbb{N}, \ n > n_{\varepsilon} \implies \left|\frac{1}{v_n} - \frac{1}{B}\right| < \varepsilon.$ 

First, we have

$$\left| \frac{1}{v_n} - \frac{1}{B} \right| = \frac{|v_n - B|}{|v_n||B|}$$

We use:

$$|B| = |B + v_n - v_n| < |B - v_n| + |v_n| \tag{2}$$

From the definition of limit, we have:

$$\left(\lim_{n \to +\infty} v_n = B\right) \Rightarrow (\forall \delta > 0, \exists n_\delta \in \mathbb{N}, \forall n \in \mathbb{N}, n \ge n_\delta \Rightarrow |v_n - B| < \delta)$$
(3)

so, we can choose:  $\delta = \frac{|B|}{2}$ . Then from (2) and (3) we find:  $|v_n| > \frac{|B|}{2}$ , and we get  $|v_n||B| > \frac{|B|^2}{2} \iff \frac{1}{|v_n||B|} < \frac{2}{|B|^2}$ , so

$$\frac{|v_n - B|}{|v_n||B|} < \frac{2|v_n - B|}{|B|^2} \tag{4}$$

also we have the choice to take:  $\delta = \frac{\varepsilon |B|^2}{2}$  in the definition (3), which leads to:

$$\left| \frac{1}{v_n} - \frac{1}{B} \right| = \frac{|v_n - B|}{|v_n||B|} < \varepsilon \tag{5}$$

Thus, the proof is concluded.

(b) We have

$$\lim_{n \to \infty} \frac{u_n}{v_n} = \lim_{n \to \infty} u_n \cdot \frac{1}{v_n} = \lim_{n \to \infty} u_n \cdot \lim_{n \to \infty} \frac{1}{v_n} = A \cdot \frac{1}{B} = \frac{A}{B}$$

#### Exercise 06:

(a) 
$$\lim_{n \to +\infty} \frac{3n^2 - 5n}{5n^2 + 2n - 6} = \lim_{n \to +\infty} \frac{3 - \frac{5}{n}}{5 + \frac{2}{n} - \frac{6}{n^2}} = \frac{3 + 0}{5 + 0 + 0} = \frac{3}{5}.$$

(b) 
$$\lim_{n \to +\infty} (\sqrt{n+1} - \sqrt{n}) = \lim_{n \to +\infty} (\sqrt{n+1} - \sqrt{n}) \frac{\sqrt{n+1} + \sqrt{n}}{\sqrt{n+1} + \sqrt{n}} = \lim_{n \to +\infty} \frac{1}{\sqrt{n+1} + \sqrt{n}} = 0.$$

(c) 
$$\lim_{n \to +\infty} \frac{1+2 \cdot 10^n}{5+3 \cdot 10^n} = \lim_{n \to +\infty} \frac{(1+2 \cdot 10^n) \cdot 10^{-n}}{(5+3 \cdot 10^n) \cdot 10^{-n}} = \lim_{n \to +\infty} \frac{1 \cdot 10^{-n} + 2}{5 \cdot 10^{-n} + 3} = \frac{2}{3}$$

(d) We have:

$$-1 \le \cos(2n^3 - 5) \le 1\tag{6}$$

So, we can write

$$\frac{-1}{3n^3 + 2n^2 + 1} \le \frac{\cos(2n^3 - 5)}{3n^3 + 2n^2 + 1} \le \frac{1}{3n^3 + 2n^2 + 1} \tag{7}$$

Thus, we find

$$-\lim_{n \to +\infty} \frac{1}{3n^3 + 2n^2 + 1} \le \frac{\cos(2n^3 - 5)}{3n^3 + 2n^2 + 1} \le \lim_{n \to +\infty} \frac{1}{3n^3 + 2n^2 + 1} \tag{8}$$

In fact, we have

$$\lim_{n \to +\infty} \frac{1}{3n^3 + 2n^2 + 1} = 0 \tag{9}$$

Then, we get

$$\lim_{n \to +\infty} \frac{\cos(2n^3 - 5)}{3n^3 + 2n^2 + 1} = 0 \tag{10}$$

(e) 
$$\lim_{n \to +\infty} \frac{e^{2n} - e^n + 1}{2e^n + 3} = \lim_{n \to +\infty} \frac{(e^{2n} - e^n + 1)e^{-2n}}{(2e^n + 3)e^{-2n}} = \lim_{n \to +\infty} \frac{1 - e^{-n} + e^{-2n}}{2e^{-n} + 3e^{-2n}} = +\infty.$$

(f)

## Exercise 07:

1. (a) For  $U_n = \sum_{k=1}^n \frac{n}{n^5 + k}$ ; we have For all  $k = 1, \dots, n$  the following inequalities:

$$n^5 + 1 \le n^5 + k \le n^5 + n \iff \frac{n}{n^5 + n} \le \frac{n}{n^5 + k} \le \frac{n}{n^5 + 1}$$

Then, we can write

$$\sum_{k=1}^n \frac{n}{n^5+n} \leq \sum_{k=1}^n \frac{n}{n^5+k} \leq \sum_{k=1}^n \frac{n}{n^5+1}$$

which means that

$$\frac{n^2}{n^5 + n} \le U_n \le \frac{n^2}{n^5 + 1}$$

As

$$\lim_{n \to \infty} \frac{n^2}{n^5 + n} = \lim_{n \to \infty} \frac{n^2}{n^5 + 1} = 0,$$

we have

$$\lim_{n\to\infty} U_n = 0.$$

(b) For  $U_n = \sum_{k=1}^n \frac{1}{\sqrt{n^3 + k}}$ 

So, we have for all k = 1, ..., n:

$$n^3 + 1 \le n^3 + k \le n^3 + n \iff \sqrt{n^3 + 1} \le \sqrt{n^3 + k} \le \sqrt{n^3 + n}$$

which leads to

$$\frac{1}{\sqrt{n^3 + n}} \le \frac{1}{\sqrt{n^3 + k}} \le \frac{1}{\sqrt{n^3 + 1}}$$

Thus, we find

$$\sum_{k=1}^{n} \frac{1}{\sqrt{n^3 + n}} \le \sum_{k=1}^{n} \frac{1}{\sqrt{n^3 + k}} \le \sum_{k=1}^{n} \frac{1}{\sqrt{n^3 + 1}}$$

which gives

$$\frac{n}{\sqrt{n^3 + n}} \le U_n \le \frac{n}{\sqrt{n^3 + 1}}$$

As

$$\lim_{n \to +\infty} \frac{n}{\sqrt{n^3 + n}} = \lim_{n \to +\infty} \frac{n}{\sqrt{n^3 + 1}} = 0.$$

Then

$$\lim_{n \to +\infty} U_n = 0$$

2. Let 
$$U_n = \sum_{k=1}^{\infty} \frac{1}{2 + |\cos k| \sqrt{k}}$$
.

For all  $k = 1, \ldots, n$ , we have

$$|\cos k| \le 1$$

$$\Leftrightarrow 2 + |\cos k|\sqrt{k} \le 2 + \sqrt{k} \le 2 + \sqrt{n}.$$

$$\Rightarrow 2 + |\cos k| \sqrt{k} \le 2 + \sqrt{n} \Leftrightarrow \frac{1}{2 + \sqrt{n}} \le \frac{1}{2 + |\cos k| \sqrt{k}}.$$

$$\Rightarrow \sum_{k=1}^n \frac{1}{2+\sqrt{n}} \leq \sum_{k=1}^n \frac{1}{2+|\cos k|\sqrt{k}} \Leftrightarrow n\left(\frac{1}{2+\sqrt{n}}\right) \leq U_n, \forall n \in \mathbb{N}.$$

As  $n \to +\infty$ ,  $\sum_{k=1}^{n} \frac{1}{2+\sqrt{n}} = +\infty$ , therefore,  $\lim_{n \to +\infty} U_n = +\infty$ .

# Exercise 8

1. By induction:

For n = 0: we have  $0 \le U_0 < 2$ .

Assume  $0 \le U_n < 2$ , then:

$$2 \le U_n + 2 < 4 \implies \sqrt{2} \le U_{n+1} < 2 \implies 0 \le U_{n+1} < 2.$$

Thus,

$$0 \le U_n < 2, \forall n \in \mathbb{N}.$$

2. Monotonicity of  $(U_n)_{n\in\mathbb{N}}$ :

$$U_{n+1} - U_n = \sqrt{U_n + 2} - U_n = \frac{U_n + 2 - U_n^2}{\sqrt{U_n + 2} + U_n}.$$

Since  $0 \le U_n < 2, \forall n \in \mathbb{N}$ , we have:

$$(U_n+1)(2-U_n)>0.$$

Hence,  $(U_n)_{n\in\mathbb{N}}$  is increasing.

- 3. Define  $V_n = 2 U_n, \forall n \in \mathbb{N}$ :
- (a) From part 1,  $U_n < 2, \forall n \in \mathbb{N}$ , so:

$$0 < V_n, \forall n \in \mathbb{N}.$$

(b)

$$\frac{V_{n+1}}{V_n} = \frac{2 - U_{n+1}}{2 - U_n} = \frac{2 - \sqrt{U_n + 2}}{2 - U_n}.$$

Simplify:

$$\frac{V_{n+1}}{V_n} = \frac{(2 - U_n)}{(2 - U_n)(2 + \sqrt{U_n + 2})} = \frac{1}{2 + \sqrt{U_n + 2}}.$$

For all  $n \in \mathbb{N}$ :

$$0 \le U_n \implies 2 + \sqrt{2} \le 2 + \sqrt{U_n + 2} \implies \frac{1}{2 + \sqrt{U_n + 2}} \le \frac{1}{2}.$$

(c) By induction:

For n = 1:  $V_1 \le 1$ .

Assume  $V_n \leq \left(\frac{1}{2}\right)^{n-1}$ , then:

$$V_{n+1} \le \frac{1}{2}V_n \le \frac{1}{2}\left(\frac{1}{2}\right)^{n-1} = \left(\frac{1}{2}\right)^n.$$

Thus:

$$V_n \le \left(\frac{1}{2}\right)^{n-1}, \forall n \in \mathbb{N}^*.$$

(d) Since:

$$0 < V_n \le \left(\frac{1}{2}\right)^{n-1}, \forall n \in \mathbb{N}^*,$$

and:

$$\lim_{n \to +\infty} \left(\frac{1}{2}\right)^{n-1} = 0,$$

it follows that:

$$\lim_{n \to +\infty} V_n = 0.$$

Since  $U_n = 2 - V_n$ , we conclude:

$$\lim_{n \to +\infty} U_n = 2.$$

## Exercise 9:

1. By induction:

For n = 0:  $U_0 > 0$ .

Assume  $U_n > 0$ , then:

$$U_n e^{-U_n} > 0 \implies U_{n+1} > 0, \forall n \in \mathbb{N}.$$

2. Monotonicity of  $(U_n)_{n\in\mathbb{N}}$ :

$$U_{n+1} - U_n = U_n(e^{-U_n} - 1).$$

Since  $U_n > 0, \forall n \in \mathbb{N}$ , we have:

$$e^{-U_n} - 1 < 0 \implies U_{n+1} - U_n < 0.$$

Thus,  $(U_n)_{n\in\mathbb{N}}$  is decreasing.

3. Convergence of  $(U_n)_{n\in\mathbb{N}}$ :

As  $(U_n)_{n\in\mathbb{N}}$  is bounded below and decreasing, it converges to its infimum.

Let:

$$\lim_{n \to +\infty} U_n = l = \lim_{n \to +\infty} U_{n+1}.$$

Then:

$$U_{n+1} = U_n e^{-U_n} \implies l = l e^{-l} \implies l(e^{-l} - 1) = 0 \implies l = 0.$$

Thus:

$$\lim_{n \to +\infty} U_n = 0.$$

4. By induction:

For n = 0:  $U_1 = e^{-U_0} = e^{-S_0}$ .

Assume  $U_{n+1} = e^{-S_n}$ , and show  $U_{n+2} = e^{-S_{n+1}}$ :

$$U_{n+2} = U_{n+1}e^{-U_{n+1}} = e^{-S_n}e^{-U_{n+1}} = e^{-S_{n+1}}.$$

Thus:

$$U_{n+1} = e^{-S_n}, \forall n \in \mathbb{N}.$$

5. We have:

$$S_n = -\ln U_{n+1}$$
, and  $\lim_{n \to +\infty} U_{n+1} = \lim_{n \to +\infty} U_n = 0$ .

Thus:

$$\lim_{n \to +\infty} S_n = +\infty.$$

## Exercise 10

## 1. By induction:

For n = 0:  $0 \le U_0 \le 2$ .

Assume  $0 \le U_n \le 2$ , then:

$$U_n \ge 0 \implies \frac{7U_n + 4}{3U_n + 3} \ge 0,$$

and:

$$U_n \le 2 \implies 7U_n + 4 \le 6 + 6U_n \implies \frac{7U_n + 4}{3U_n + 3} \le 2.$$

Thus:

$$0 \le U_{n+1} \le 2.$$

Consequently:

$$0 \le U_n \le 2, \forall n \in \mathbb{N}.$$

2. Monotonicity of  $(U_n)_{n\in\mathbb{N}}$ :

$$U_{n+1} - U_n = \frac{7U_n + 4}{3U_n + 3} - U_n = \frac{-3U_n^2 + 4U_n + 4}{3U_n + 3}.$$

This simplifies to:

$$U_{n+1} - U_n = \frac{(2+3U_n)(2-U_n)}{3U_n + 3}.$$

Since  $0 \le U_n \le 2, \forall n \in \mathbb{N}$ , we have:

$$(2+3U_n)(2-U_n) \ge 0.$$

Moreover,  $3U_n + 3 > 0$ , so  $(U_n)_{n \in \mathbb{N}}$  is increasing.

3. Convergence of  $(U_n)_{n\in\mathbb{N}}$ :

Since  $(U_n)_{n\in\mathbb{N}}$  is bounded and increasing, it converges to its supremum.

Let:

$$\lim_{n \to +\infty} U_n = l = \lim_{n \to +\infty} U_{n+1}.$$

Then:

$$U_{n+1} = \frac{7U_n + 4}{3U_n + 3} \implies l = \frac{7l + 4}{3l + 3}.$$

Simplify:

$$3l^2 - 4l - 4 = 0 \implies (2+3l)(l-2) = 0.$$

Thus:

$$l = 2$$
 or  $l = -\frac{2}{3}$ .

Since  $U_n \geq 0$ , we have  $l \geq 0$ , so:

$$\lim_{n \to +\infty} U_n = 2.$$

4. Extremes of  $E = \{U_n \mid n \in \mathbb{N}\}:$ 

From above:

$$\sup E = \lim_{n \to +\infty} U_n = 2.$$

Since  $(U_n)_{n\in\mathbb{N}}$  is increasing,  $U_0$  is a lower bound for E:

$$U_0 \leq U_n, \forall n \in \mathbb{N}.$$

Moreover,  $U_0 \in E$ , so:

$$\min E = U_0 = \inf E.$$

## Exercise 11

1.

$$W_{n+1} = V_{n+1} - U_{n+1} = \frac{U_{n+3}V_n}{4} - \frac{U_{n+2}V_n}{3} = \frac{1}{12}W_n.$$

Hence,  $(W_n)_{n\in\mathbb{N}^*}$  is a geometric sequence with ratio  $r=\frac{1}{12}$ :

$$W_n = W_1 \left(\frac{1}{12}\right)^{n-1} = \frac{11}{12^{n-1}},$$

and thus:

$$\lim_{n \to +\infty} W_n = 0.$$

2. Monotonicity of  $(U_n)_{n\in\mathbb{N}^*}$ :

$$U_{n+1} - U_n = \frac{U_n + 2V_n}{3} - U_n = \frac{2}{3}(V_n - U_n) = \frac{2}{3}W_n.$$

Since  $W_n > 0, \forall n \in \mathbb{N}^*$ , it follows that:

$$U_{n+1} - U_n > 0,$$

hence  $(U_n)_{n\in\mathbb{N}^*}$  is increasing.

3. Monotonicity of  $(V_n)_{n\in\mathbb{N}^*}$ :

$$V_{n+1} - V_n = \frac{U_n + 3V_n}{4} - V_n = -\frac{1}{4}(V_n - U_n) = -\frac{1}{4}W_n.$$

Since  $W_n > 0, \forall n \in \mathbb{N}^*$ , it follows that:

$$V_{n+1} - V_n < 0,$$

hence  $(V_n)_{n\in\mathbb{N}^*}$  is decreasing.

4. Adjacency of  $(U_n)_{n\in\mathbb{N}^*}$  and  $(V_n)_{n\in\mathbb{N}^*}$ :

$$\lim_{n \to +\infty} (V_n - U_n) = \lim_{n \to +\infty} W_n = 0.$$

Thus,  $(U_n)_{n\in\mathbb{N}^*}$  and  $(V_n)_{n\in\mathbb{N}^*}$  are adjacent sequences.

#### Exercise 12

1. Cauchy sequence  $(U_n)_{n\in\mathbb{N}}$ :

$$U_n = \sum_{k=0}^n \frac{\sin k}{2^k}, \quad \forall n \in \mathbb{N}^*.$$

The sequence  $(U_n)_{n\in\mathbb{N}}$  is a Cauchy sequence if and only if:

$$\forall \epsilon > 0, \exists n_{\epsilon} \in \mathbb{N}; \forall p, q \in \mathbb{N}: \begin{cases} n_{\epsilon} \leq p \\ n_{\epsilon} \leq q \end{cases} \implies |U_{p} - U_{q}| < \epsilon.$$

Given  $\epsilon > 0$ ,  $p, q \in \mathbb{N}$ , assume p > q:

$$|U_p - U_q| = \left| \sum_{k=1}^p \frac{\sin k}{2^k} - \sum_{k=1}^q \frac{\sin k}{2^k} \right| = \left| \sum_{k=q+1}^p \frac{\sin k}{2^k} \right|.$$

Since  $|\sin k| \le 1, \forall k$ , we have:

$$|U_p - U_q| \le \sum_{k=q+1}^p \frac{1}{2^k}.$$

The sum:

$$\sum_{k=q+1}^{p} \frac{1}{2^k} = \frac{1}{2^{q+1}} + \frac{1}{2^{q+2}} + \dots + \frac{1}{2^p},$$

is the sum of p-q terms of a geometric sequence with ratio  $\frac{1}{2}$ . Hence:

$$\sum_{k=q+1}^{p} \frac{1}{2^k} = \frac{1}{2^{q+1}} \left( \frac{1 - \frac{1}{2^{p-q}}}{1 - \frac{1}{2}} \right) = \frac{1}{2^q} \left( 1 - \frac{1}{2^{p-q}} \right).$$

Thus:

$$\sum_{k=q+1}^{p} \frac{1}{2^k} \le \frac{1}{2^q}.$$

Therefore:

$$|U_p - U_q| \le \frac{1}{2^q}.$$

To ensure  $|U_p - U_q| < \epsilon$ , it suffices that:

$$\frac{1}{2^q} < \epsilon \implies q > \frac{-\ln \epsilon}{\ln 2}.$$

Thus, take  $n_{\epsilon} = \left\lceil \frac{-\ln \epsilon}{\ln 2} \right\rceil + 1$ . 2. Non-Cauchy sequence  $(V_n)_{n \in \mathbb{N}}$ :

$$V_n = \sum_{k=2}^n \frac{1}{\ln k}, \quad \forall n \ge 2.$$

The sequence  $(V_n)_{n\in\mathbb{N}}$  is not a Cauchy sequence if:

$$\exists \epsilon > 0, \forall n \in \mathbb{N}; \exists p, q \in \mathbb{N}: \begin{cases} n \leq p \\ n \leq q \end{cases} \land |V_p - V_q| \geq \epsilon.$$

Let q = n and p = 2n:

$$|V_p - V_q| = |V_{2n} - V_n| = \sum_{k=n+1}^{2n} \frac{1}{\ln k}.$$

Since  $\ln k < k, \forall k > 0$ , we have:

$$\sum_{k=n+1}^{2n} \frac{1}{\ln k} > \sum_{k=n+1}^{2n} \frac{1}{k}.$$

For k such that  $2 \le k \le 2n$ :

$$\frac{1}{k} \ge \frac{1}{2n},$$

so:

$$\sum_{k=n+1}^{2n} \frac{1}{k} \ge \sum_{k=n+1}^{2n} \frac{1}{2n}.$$

Finally:

$$\sum_{k=n+1}^{2n} \frac{1}{2n} = \frac{1}{2},$$

hence:

$$|V_p - V_q| > \frac{1}{2}.$$

Take  $\epsilon = \frac{1}{2}$ .
